
Washington State University Cherry Cultivar Releases

GlacierTM

Parents: *Stella* x *Early Burlat*
Cross made in 1971 by Tom Toyama.
Tested as PC7144-7.

U.S. Plant Patent (#8051) assigned to Washington State University Research Foundation and licensed in North America to the Northwest Nursery Improvement Institute.

GlacierTM is a large mid-season, self-fruitful black, round sweet cherry. It is not as firm as *Bing*, so it may not be suitable for shipping to long-distance markets. Its large size and self-fruitful characteristic make it most suitable for home growers. Its stems are long and slender. The flesh is dark-red and juicy.

***Glacier*TM** is a late blooming variety so it may avoid damage from spring frosts. It is self-fertile so it doesn't need cross-pollinizers.

Production and compatibility of *Glacier*TM on rootstocks other than Mazzard is unknown at this time.
