

Other pathology trials for potatoes in Michigan, 2019.

Chris Bloomingdale and Jaime Willbur

Dept. Plant, Soil and Microbial Science, Michigan State University

Two additional trials were established at Michigan State University research farms to investigate disease of potatoes in Michigan. At the Plant Pathology Research Farm, a trial was established to investigate the efficacy of a foliar applied experimental compound at managing early blight. The second trial investigated the management of potato early die using different Russet varieties with and without a fall fumigation program. These experiments are still in early stages, but results are available upon request.
