MICHIGAN CORN PERFORMANCE TRIALS

*M. P. Singh, W. D. Widdicombe and L. A. Williams
Department of Plant, Soil, and Microbial Sciences
Michigan State University*

Introduction

The Michigan State University (MSU) Department of Plant, Soil and Microbial Sciences conduct Michigan Corn Performance Trials (MCPT) each year in cooperation with Michigan State University AgBio Research, The Ohio State University, seed corn companies, and farmers to determine yield and quality performance.

Entries

Seed companies are invited to enter hybrids in the trials; a fee is charged to cover expenses incurred while conducting the trials. Separate indexes for grain and silage provide a list of all hybrids entered in the 2017 trials (pg. 26, 31, respectively). Twelve grain and nine silage locations were planted. A total of 322 hybrids from 30 brand names make up the 528 entries; that translates into 6,336 separate county plots planted. Company names used in association with hybrid numbers refer to the brand. The hybrid numbers are the companies' designations.

Hybrids that have a seed-applied insecticide that may enhance yield are listed in the table column **TRT** (Treatment). The "**TRAIT**" column uses code numbers, listing the hybrid traits provided by the company. Treatment and trait codes are listed in the tables on page 19.

How to Use This Bulletin

Tables list hybrids alphabetically and contain yield results for each location, plus zone averages. Complete one and two-year yield results are listed in tables for each zone where data is available. One-year single-site results are less reliable than multiple year and multiple location averages, and should be interpreted with more caution. Confidence in corn performance data increases as the number of years and the number of testing locations increase. Results for corn grain and corn silage trials are also listed on our Web site:

<http://www.varietrials.msu.edu>

To obtain additional published copies of this bulletin please contact the Michigan State University Extension Bulletin Office at the following:

166 Service Rd.
East Lansing, MI 48824
(517) 884-6240

The results shown are the average of four replications grown in close proximity to one another. Two or more plots of the same hybrid in the same field may produce somewhat different results because of uncontrolled variability in the soil and other environmental factors. Replication and randomization of the entries were two methods employed to reduce this variation. Because these methods do not eliminate all variables, the magnitude of difference necessary for statistical significance has been calculated for yield, moisture content, and test weight. The value calculated as the least significant difference

(LSD) is the amount an individual hybrid would have to differ from another hybrid in the same test to be considered significantly different from that hybrid. The coefficient of variability, (CV) is indicative of a trials precision. Trials with low levels of error variation have lower CV values.

The highest yielding hybrid in each trial is indicated with a double asterisk (**) in each table, hybrids that are not significantly different from the highest yielding hybrid are indicated with an asterisk (*). Other agronomic information relative to each trial is given in table B (pg. 25) for the grain trials and table C (pg. 30) for the silage trials. Fertilizer amounts are shown as total pounds per acre of nitrogen, P₂O₅, and K₂O applied during the season.

Season in Summary: 2017

Entry forms for participating companies were due March 15th; by the end of March we began receiving the hybrids that made up our trials. After a lot of paper work, printing of labels and placing labels on packets, our students began counting the seeds and filling the packets. Packets were sorted by trial and location and placed in a computer generated random planting order. Some of our seed comes from winter production in South America. We are usually receiving seed up to the morning we leave the Agronomy Farm for the first day of planting.

Planting commenced in Wexford County on May 8th and ended in Lenawee County on June 2nd.

We were not in the Upper Peninsula (UP) for the 2017 season. We took this past year to reorganize and restructure the tasks that the MCPT team and the UP Research and Extension Center (UPREC) team will be performing to better achieve prompt planting, weed control, fertilizer applications and stand counts. In addition, our hope is to better mirror the hybrids that are commercially available in the UP by working in cooperation with the University of Wisconsin to obtain hybrids entered in their corn performance trials. We expect to be back in Menominee County in 2018.

We also rearranged some locations this year. Although the trials were not in the Upper Peninsula in 2017, the hybrid entries that would have been entered there were split between Iosco County and Presque Isle County (new location). The Grand Traverse and Osceola County locations were dropped; the grain and silage entries at those locations were combined into a single location in Wexford County (new location).

Weed control was applied at all trial locations. All but one weed control application was performed by our cooperators or commercial applicators. Fertilizer applications were consistent with rates that were necessary based on soil type, soil samples and cooperator recommendations for their field.

Stand counts went pretty well this year. All trials were counted and thinned to a uniform stand around the V5 or V6 stage. All locations except Wood County, Ohio were thinned back to a population of 35,244. Wood County, Ohio was thinned to 34,452.

2017

GROWING SEASON WEATHER SUMMARY

*Jeff Andresen, Extension Agricultural Meteorologist
Department of Geography
Michigan State University*

The 2017 growing season will go into the books as warmer and wetter than normal in most areas of Michigan, although as is often the case, the mean of several months masks large variability in temperatures both over time and location. Crops in some areas of the state were hurt by extended dryness during the latter part of the summer, and by excessive rainfall late in the season into the fall in others. In contrast, across some northern sections of the state, the summer was among the wettest on record.

The 2016/2017 winter that preceded the growing season was also milder and wetter than normal with statewide mean temperatures of 26.8°F (6.6°F above normal) and average total precipitation of 7.10" (1.79" above normal), leaving it as the 6th warmest winter on record (since 1895) and the 2nd consecutive much milder than normal winter following back to back severe cold winters in 2013/2014 and 2014/2015. The mild weather of the late winter rapidly reduced snow cover in northern sections of the state and brought many overwintering annuals and perennials out of dormancy at least 2 weeks earlier than is normally the case. Given the mild temperatures, seasonal snowfall totals were below normal in all but extreme northern Lower and eastern Upper Michigan.

A series of strong upper air troughs moved across the Great Lakes region during early March, resulting in several periods of unsettled weather and to the return of colder than normal temperatures in the region. A prolonged high wind event caused widespread power outages and property damage (mostly uprooted trees) on the 8th of March. The event was associated with an unusually large difference in surface air pressure between an intense low over northern Ontario and a ridge of high pressure over the southern and western U.S. along with strong jet stream winds passing aloft over the region at the same time. Sustained winds at many locations in the state were at or above 40 mph for several hours, with occasional gusts between 60-70 mph. Such high winds are very uncommon in Michigan for extended periods of time. More than one million customers in the state were left without power, likely a record number from a historical perspective. During late March and early April, jet stream flow across North America broke into two branches, one to our north across Canada and the other southern branch across the Lower 48 states. This change effectively shut off the flow of cold air masses from the north into the region while the southern branch supported an active storm track across the Midwest. Precipitation totals from mid-March through mid-April ranged from less than 2.00" in western portions of Upper Michigan to more than 6.00" (more than 200% of normal) across southern, central, and northeastern sections of the Lower Peninsula. In northern sections of the state, some of the precipitation fell in the form of snow, sleet, and freezing rain. Given wetter than normal weather during much of the preceding winter season, soils by were left at field capacity to saturation by mid-April, with standing water across in many spots across the southern half of the Lower Peninsula. NOAA's Palmer Drought Severity Index which tracks long term moisture surpluses and deficits categorized almost all of the Upper Midwest region including Michigan in wetter than normal conditions ranging from "Unusually Moist" to "Extremely Moist" at the end of April.

The development of an upper air trough across the Great Lakes region during the first week of May led to an extended period of cooler than normal temperatures and widespread frost and freezing temperatures on the mornings of the 8th and 9th which damaged some fruit and vegetable crops. With mostly northwesterly flow across the region, the upper air change also brought a temporary end to the series of low pressure systems and widespread rainfall that hindered nearly all spring fieldwork activities across the state. The cool, dry weather allowed a gradual return to fieldwork during the second week of the month. After a period of summer-like weather during the third week of May, an upper air troughing pattern redeveloped across the Great Lakes region during the last week of the month, resulting in a cool, unsettled weather pattern that persisted into early June. While some northern and southeastern portions of the state continued to experience persistent rainfall and spring fieldwork delays, many other areas saw an extended break in the wetter than normal weather and were able to make rapid planting progress.

During June, weather conditions varied widely across Michigan. A series of low pressure centers and associated frontal boundaries passing through the Upper Midwest late in the month led to several rounds of showers and thunderstorms across much of the state. Two events, the first on the 17th-19th, and the second on the 22nd-23rd resulted in heavy rain, flooding, and crop damage across some areas, particularly in central sections of the Lower Peninsula. In stark contrast, many southern sections of the state were repeatedly missed by the precipitation with the gradual development of moisture stress symptoms, and as of late June southeastern sections of the state were categorized by the U.S. Drought Monitor as 'D0: Abnormally Dry' (at the same time, much of northern Michigan was classified by the Palmer Drought Severity Index as 'Unusually', 'Very', or 'Extremely Moist'). Precipitation totals for June ranged from less than 1.50" across southern sections of Lower Michigan to more than 10.00" across central Lower and south central Upper Michigan. Monthly mean temperatures were close to the long term normals, with mean values ranging from near normal levels in northern sections of the state to 1-2°F above normal in the south.

A persistent broad upper air ridge across central sections of the U.S. led to a wide range of weather extremes during July ranging from heat and severe drought conditions across the northern Great Plains to heavy rains and flooding through portions of the Upper Midwest. In Michigan, monthly rainfall totals ranged less than 2.00" in some central and southern sections of Lower and western Upper Michigan to more than 6.00" across portions of the northern Lower and eastern Upper Peninsulas. Mean temperatures for the month were very close to normal across central and southern sections of the state to slightly below normal across the north.

- Weather Continued From Page 4

In general, this weather combination favored growth and development of most spring-planted annual crops, many of which were entering stages of peak water needs. However, impacts varied greatly by crop and location, ranging from saturated soils, localized flooding, delayed wheat harvest in areas hit by heavy rains (mostly northern sections of the state) to unfavorably dry soils and increasing levels of moisture stress in other locations repeatedly missed by the rainfall (sections of southern and central Lower Michigan).

Cooler and drier than normal weather was the rule across much of Michigan during the last half of August and early September, thanks to a persistent upper air troughing feature across the region. Mean temperatures for the month of August ranged from near normal across extreme eastern sections of the state to more than 4°F below normal across western sections of Upper Michigan. Given the cooler temperatures, crop growth and development continued to lag behind normal levels in many areas, especially across northern sections of the state. The first observations of frost and freezing temperatures in state this season occurred across sections of western and central Upper Michigan on the 24th and 25th, which is at least one week ahead of normal. Crop impacts resulting from the cold temperatures were generally minor. Rainfall totals for the month ranged from less than 2.00" across southern and central sections of Lower Michigan to more than 6.00" across portions of the Upper Peninsula. Persistent drier than normal across sections of southern and central Lower Peninsula led continued moisture stress and early senescence of crops.

A long anticipated jet stream change across North America finally took place during the second week of September with the replacement of the persistent upper air troughing pattern that brought cooler than normal weather to much of the Midwest and Great Lakes region during the late summer with a ridge that resulted in a return of above normal temperatures. The ridging pattern strengthened during late September, resulting in a prolonged period of abnormally hot and dry weather to Michigan and much of the Midwest, with many areas reporting a daily consecutive string of 90°F or higher maximum temperatures from the 21st through the 26th. Combined with below normal rainfall totals in most areas, the warm weather led to rapid maturation and senescence of most annual crops and favored early harvest activities. The brief incursion of a cool, Canadian-origin air mass at the end of the month led to frost and freezing temperatures across portions of the Upper and northern Lower Peninsulas on the 30th and 1st of October. Given the late month heat wave, mean temperatures for September were above normal state- and region-wide, with mean departures from normal in Michigan generally ranging from 3-6°F above normal. Precipitation totals for the month were generally well below normal levels, ranging from more than 3.00" across far northern portions of the state to less than 1.00" across most of the southern half of the Lower Peninsula. Since early July, rainfall totals in some central portions of the Lower Peninsula were less than 4.00" (less than 50% of normal), resulting in abnormally low levels of soil moisture and to significant water stress for many crops. The dryness also delayed winter wheat planting in some areas of the state due to insufficient soil moisture for germination. At the end of September, the US Drought Monitor categorized most of the southern half of Lower Michigan in "D0 Abnormally Dry" conditions, with south central sections at "D1 Moderate Drought".

A breakdown of the upper air ridging pattern across the Upper Midwest in early October led to the development of a very active storm track through the Great Lakes region and at some Michigan locations to the heaviest rainfall since the spring season. During a 10-day period from the 5th-15th of October, rainfall totaled 3.00-6.00" across many southern and western portions of the state. Some southwestern sites in the state recorded more than 8.00". The rainfall led to an abrupt halt of fall harvest and other fieldwork activities and to some localized flooding in southwestern Lower Michigan. On the positive side, given the abnormal dryness that preceded the rainfall, much of the precipitation was able to infiltrate into the rooting zone, relieve long term stress for most perennial crops, and begin seasonal moisture recharge with relatively little runoff. The late season moisture also greatly benefitted germination and early establishment of recently-planted winter wheat. The active weather pattern continued across the Upper Midwest during the second half of October and into early November with the passage of a series of upper level troughs and low pressure systems, leading to additional rounds precipitation and to further delays in fall harvest and other fieldwork activities. The incursion of a seasonably cold Canadian-origin air mass late in the month behind one of the low pressure systems led to the first freeze of the fall season across most of central and southern Lower Michigan. For many areas of the state, the first freeze of the season was at least two weeks later than normal. The colder air also led to the first significant snowfalls of the season across much of the Upper and northern Lower Peninsulas during the last week of the month. Precipitation for the month of October ranged from less than 4.00" across eastern sections of Lower Michigan and the southern Upper Peninsula to more than 10.00" across southwestern sections the Lower Peninsula (up to 300% of normal). For the state as a whole, October was the wettest on record, with a statewide average total of 6.60", which is 3.90" above normal. Surprisingly, problems with flooding and excess water during the late October and early November were relatively localized and fewer in number than would normally be expected due to the prolonged and abnormal dryness during the late summer and early fall that preceded the rainfall. Mean temperatures for the October were warmer than normal statewide, ranging from about 2°F above normal across western sections of Upper Michigan to more than 6°F above normal central Lower Michigan.

- Season Continued From Page 3

We began harvesting silage trials on September 20th in Lenawee County and finished on September 29th with the Iosco County silage trial.

Grain harvest began October 19th on the Huron County trial and ended on the Branch County trial on November 14th. Saginaw County late and Ingham County Conventional Late trials were dropped due to flooding and drought, respectively.

Table A (pg. 5) presents 2017 accumulations of temperature, rainfall, and heat units, plus their deviation from 30 year norms. Data is obtained from Michigan State University weather stations located closest to each trial location. Actual accumulation at each location may vary slightly. The weather summary is provided by Dr. Jeff Andresen from the Department of Geography using data from the Michigan State University Agricultural Weather Office.

2017 GRAIN PERFORMANCE TRIALS

Introduction

The grain index (pg. 26) contains a list of all hybrids planted in the 2017 grain trials.

County results are reported in the following tables:

Tables 1E/1L Zone 1 - Branch, Cass and Washtenaw

Table's 2E/2L Zone 2 – Allegan, Ingham and Saginaw (Saginaw County late trial dropped)

Tables 3E/3L Zone 3 - Huron, Mason and Montcalm

Table 4E/4L Zone 4 –, Iosco, Presque Isle and Wexford

Table's 5E/5L Conventional Trial – Ingham, Montcalm (Zone 3) and Saginaw (Zone 2) (Ingham County Conv. Late trial dropped)

The map of Michigan (lower right) shows each zone and the locations where the trials were located.

Methods

Three trial locations were planted in each of four maturity zones. These zones were based on available growing degree-day units (GDU) established from long-term weather records. Hybrids entered in a zone were tested in each of the three designated locations. Entries for zone 1, zone 2, and zone 3 were divided into two maturity groups, early and late, on the basis of relative maturity (RM) provided by the seed companies. In zone 4 hybrids were tested in two groups.

Planting is accomplished with an Almaco vacuum planter. A cable with “bobbins” that are set at twenty-five foot intervals assure the uniform length of 22 foot long plots with a 3 foot alleyway and were planted at 30-inch row spacing. Four-row plots were used at all grain locations. The two center rows were harvested for yield. Experimental design, data acquisition, analysis of variance and data summarization were facilitated in part by AGROBASE Generation II™. The experimental layout was a four-replication, randomized complete block design. Hybrid performance is reported as the adjusted mean averaged together from four replicated plots.

Variety trials were conducted on farmers' fields and Michigan State University AgBioResearch Stations. All hybrids in a location were managed uniformly with the same fertilizers, date of planting, and other management practices. In the field, hybrids were identified only by a plot number to assure unbiased comparisons. Trials in Branch, Cass and Mason counties were irrigated.

Stand counts (%Std) were recorded in June. Average trial population plus the desired population rates are listed with other important agronomic information in Table B (pg. 25). Stalk lodging (%SL) measurements were recorded during harvest. All plants broken below the ear and/or leaning more than 45 degrees were counted. Moisture content (%H₂O) and field weights were measured by a Harvest Master™ single plot high capacity Grain Gage™ HM800 System that is mounted on the Kincaid 8-XP plot combine. Grain moisture (Bu/A) is reported at the standard 15.5 percent. Data was recorded on a Panasonic FZ-G1 Toughpad using Harvest Master™ Software. Grain test weight (Twt) is reported at harvest moisture.

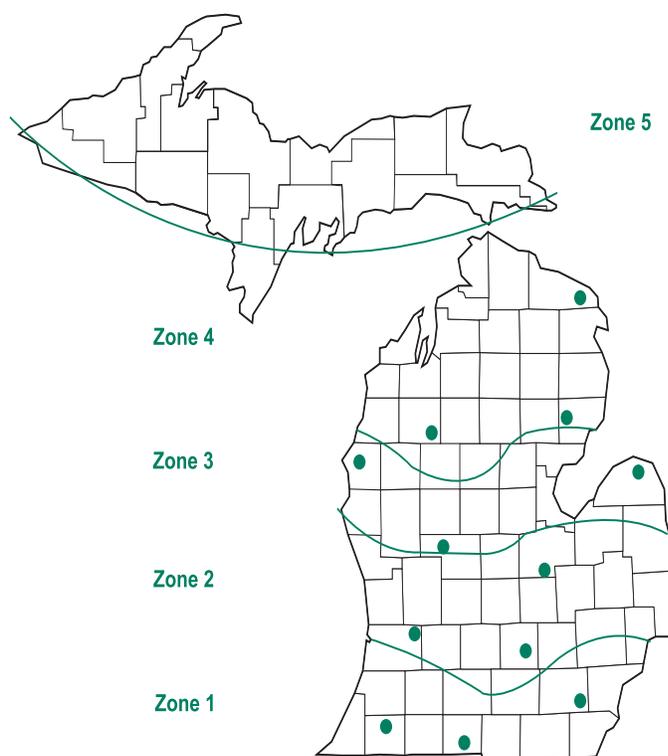

Automated test weight equipment loses some accuracy as harvest moistures increase. Test weight values should be used to determine relative rank and not as a precise weight.

Results

The tables report the following information about the hybrids tested:

1. Moisture content at harvest (%H₂O)
2. Yield (in bushels per acre) of shelled corn corrected to 15.5 percent moisture (Bu/A)
3. Test weight at harvest moisture (Twt)
4. Percent of stalk lodging (plants broken below the ear and/or 45 degrees off vertical at harvest) (%SL)
5. Percent stand of target population (%Std)

New Cropping Systems Agronomist

Maninder (Manni) Singh, Ph.D.
 Plant and Soil Sciences Building
 1066 Bogue St. Rm A482,
 East Lansing, MI 48824
 Telephone: (517) 353-0226
msingh@msu.edu

Assistant Professor of Cropping Systems Agronomy, Michigan State University. Applied research and extension program in corn, soybean and wheat based cropping systems.

Dr. Maninder (Manni) Singh is the new agronomist with Michigan State University. Dr. Singh began leading the Michigan Corn Performance Trials (MCPT) team in November 2016. Dr. Singh came to us from the University of Florida. At the University of Florida, Dr. Singh's agronomic research was focused in diverse cropping systems including peanut, sorghum, sugarcane, energy cane, and other perennial grasses.

Overview of current program at Michigan State University:

Dr. Singh's research, extension, and teaching program focuses on current and emerging issues in Michigan cropping systems with an overall goal to improve the profitability and sustainability of these systems. Current research includes: hybrid and variety selection, planting dates, seeding densities, precision planting, and plant-pathogen interactions in corn, soybean, and wheat based cropping systems. Additionally, Dr. Singh is the lead agronomist for the Michigan corn hybrid testing program. Please feel free to contact Dr. Singh with any questions you may have.

Courses Taught at Michigan State University:

CSS212 Advanced Crop Production, every fall semester.

General area of expertise:

Cropping systems, Agronomy, Crop Physiology.

Education:

Doctor of Philosophy (Ph.D.), University of Florida, Agronomy, 2007 – 2011
 Master of Science (M.S.), Punjab Agricultural University- India, Agronomy, 2004 – 2006
 Bachelor of Science (B.S. Hons.), Guru Nanak Dev University-India, Agriculture, 2000-2004

Professional Career:

Assistant Professor, Dept. of Plant, Soil, and Microbial Sciences, Michigan State University, Nov. 2016 – Present
 Assistant Scientist, Everglades Research and Education Center, University of Florida, May 2013 – Oct. 2016
 Post-doctoral Research Associate, Agronomy dept., University of Florida, Aug. 2011 – May 2013

2017 SILAGE PERFORMANCE TRIALS

Introduction

The silage index (pg. 31) contains a list of all hybrids planted in the 2017 silage trials.

County results are reported in the following tables:

Tables 6E/6L Zone 1 - Branch, Lenawee, and Wood County, OH

Tables 7E/7L Zone 2/3 – Huron (Zone 3), Ingham and Ottawa

Tables 8E/8L Zone 4 – Iosco, Presque Isle and Wexford

The map of Michigan (pg. 29) shows each zone and the locations where the trials were located.

Methods

Testing procedures (randomization, replication, planting rates, etc.) for silage evaluation are the same as those utilized for the grain trials. For silage agronomic information refer to Table C (pg. 30)

All maturity zones were divided into two maturity groups designated early and late on the basis of the relative maturity (**RM**) submitted by the companies with results listed in separate tables. In cooperation with The Ohio State University, Wood County, OH location is planted and managed by The Ohio State University while Michigan State University performs harvest, quality and data analysis.

A New Holland T6.175 tractor powered a two-row Champion C1200 Kemper forage harvester and a rear mounted Haldrup M-63 Weigh system to harvest the two center rows. Electronic scales mounted on the Haldrup M-63 weigh system measured plot and subsample weights. All field data was recorded on a Panasonic FZ-G1 Toughpad using Harvest Master™ software. Total plot weight was used to calculate green tons per acre (**GT/A**). Sub samples of fodder including grain were collected, weighed, oven dried in a WRH586-500 Greives forced air dryer until weight loss was zero, then re-weighed to determine the percent dry matter (**%DM**). Dry tons per acre (**DT/A**) is calculated mathematically by multiplying **GT/A** by **%DM**. The samples were ground using a Christy mill fitted with a 1mm screen before conducting quality analysis using Near-infrared spectroscopy (NIRS) to predict quality components.

Silage Analysis

Tables 6E, 6L, 7E, 7L, 8E and 8L provide silage quality data as determined by Near-infrared Spectroscopy (NIRS) analysis on freshly dried & ground samples. Data is provided for individual locations and also averaged over multiple locations. Near-infrared spectral analysis involves irradiating the sample with light in the near infrared spectrum (1,100 to 2,500 nm). The illuminated sample absorbs light proportional to specific chemical and physical properties. The reflected energy is measured and correlated statistically with the NIRS Consortiums calibration equation established for silage quality levels. Results of the six quality traits analyzed are presented in the quality tables. The six quality traits are:

1. **IVD=(in vitro) digestible dry matter-48hr.** IVD is a measure of forage digestibility. Higher IVD is desirable.
2. **ADF=acid detergent fiber.** ADF represents the less digestible portion of the corn forage, containing cellulose, lignin, and heat damaged protein. ADF is closely related to the digestibility of forages. Lower ADF implies the forage is more digestible. More mature plant material will contain higher ADF concentrations. A low concentration of ADF is desirable.
3. **NDF=neutral detergent fiber.** NDF is a measure of the fiber content of the corn forage. It is less digestible than non-fiber constituents of the forage. Forages with high NDF levels have lower energy. NDF is also a measure of potential forage intake. High NDF levels decrease the potential forage intake. Low NDF content is desirable.
4. **NDFD=neutral detergent fiber digestibility-48hr.** NDFD is the portion of neutral detergent fiber digested by animals at a specified level of feed intake. High NDFD is desirable.
5. **CP=crude protein.** Forages are generally supplemented with high protein concentrates such as soybean meal to increase the protein content of ruminant diets. Corn hybrids with high protein levels require less supplementation and therefore result in lower feed costs. High protein content is desirable.
6. **STRCH=starch.** Starch from the grain, along with the digestible component of the fiber, accounts for the majority of the energy in corn silage. High Starch content is desirable.

Silage quality traits are reported on a dry matter basis (100 percent DM). Quality traits in these tables are intended for use in hybrid selection only. Analysis for the balancing of feed rations should be analyzed from hybrids grown on each individual farm.

2017 HANDY BT TRAIT TABLE

*Chris DiFonzo, Michigan State University
Pat Porter, Texas A&M University
Kelley Tilmon, The Ohio State University*

Most corn hybrids planted in the U.S. contain one or more transgenic traits for weed or insect management. These traits can increase flexibility and profitability for producers, but sometimes cause confusion about their spectrum of control or refuge requirements. The Handy Bt Trait Table provides a helpful list of trait names (below) and details of trait packages (next page) to make it easier to read company seed guides, sales materials, and bag tags.

New for 2018

- ✓ To make the trait table easier to read, the “Marketed for” and “Herbicide tolerance” columns were redesigned to replace abbreviations (letters) for insect names and herbicide traits with a simple ‘X’. This design was rated easier to read by people with aging eyes, including the authors.
- ✓ Trait packages are now alphabetized, instead of being grouped by seed company.
- ✓ Trecepta, a new pyramid for broad spectrum Lepidoptera control, was added to the list.
- ✓ Based on strong evidence in lab assays and field performance, companies revised their claim of control of western bean cutworm by the Cry1F Bt protein (i.e., the Herculex trait). Only hybrids with the Vip3A Bt protein provide reliable control of this insect. For all other hybrid packages, manage western bean cutworm infestations using a combination of scouting and spraying at threshold for your area.

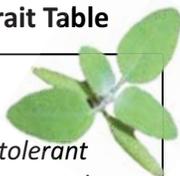

Field corn ‘events’ (transformations of one or more genes) and their Trade Names

Trade name for trait	Event	Protein(s) expressed	Insect Target + Herbicide Activity
Agrisure CB/LL	Bt11	Cry1Ab + PAT	corn borer + <i>glufosinate tolerance</i>
Agrisure Duracade	5307	eCry3.1Ab	rootworm
Agrisure GT	GA21	EPSPS	<i>glyphosate tolerance</i>
Agrisure RW	MIR604	mCry3A	rootworm
Agrisure Viptera	MIR162	Vip3A	broad lep control (but not corn borer)
Herculex 1 (HX1) or CB	TC1507	Cry1Fa2 + PAT	corn borer + <i>glufosinate tolerance</i>
Herculex CRW	DAS-59122-7	Cry34Ab1/Cry35Ab1 + PAT	rootworm + <i>glufosinate tolerance</i>
(None – part of Qrome)	4114	Cry1F + Cry34Ab1/Cry35Ab1 + PAT	corn borer+ rootworm+ <i>glufosinate tol.</i>
Roundup Ready 2	NK603	EPSPS	<i>glyphosate tolerance</i>
Yieldgard Corn Borer	MON810	Cry1Ab	corn borer
Yieldgard Rootworm	MON863	Cry3Bb1	rootworm
Yieldgard VT Pro	MON89034	Cry1A.105 + Cry2Ab2	Lepidopteran control
Yieldgard VT Rootworm RR	MON88017	Cry3Bb1 + EPSPS	rootworm + <i>glyphosate tolerance</i>

Abbreviations used in the Trait Table

Herbicide activity

GT *glyphosate tolerant*
LL Liberty Link - *glufosinate-tolerant*
RR2 Roundup Ready 2, *glyphosate-tolerant*

Insect targets

BCW black cutworm SB stalk borer
CEW corn earworm SCB sugarcane borer
CRW corn rootworm SWCB southwestern corn borer
ECB European corn borer TAW true armyworm
FAW fall armyworm WBC western bean cutworm

THANK YOU TO OUR FARM COOPERATORS:

ZONE 1

Baker-Ladd Farms, Blaine Baker, Clayton
George Brossman, Vandalia
Kyle Huff, Coldwater
OSU NW Experiment Station, Matt Davis &
Richard Minyo Hoytville, Ohio
Matthew Talladay, Milan

ZONE 2

Fred Gross Farms
Peggy Gross & Dick Birchmeier, New Lothrop
Jorgensens Farm Elevator
Jerry Jorgensen & Mike Turner, Williamston
Eadie Farms
Arden Eadie, Conklin
MSU Agronomy Farm, Mike Particka, East Lansing
Jim & John Schipper, Martin

ZONE 3

Karnatzs Farms, Scott Karnatzs
Robert Oshe & Jacob Zwagerman, Custer
Wil-le Farms, Ron & Ed McCrea, Bad Axe

ZONE 4/5

Double B Dairy
Jeremy & Tim Beebe, Whitmore
Ponik Farms
Paul Ponik, Posen
John Bode, Cadillac

THANK YOU TO THOSE WHO HELPED:

Thomas Siler
Kaitlyn Blaine
Emily Wildt
Leah Gruber
Caitlin Clover
Paige Remenar
Henry Gruber

MICHIGAN STATE
UNIVERSITY

Extension

MSU is an affirmative-action, equal-opportunity employer, committed to achieving excellence through a diverse workforce and inclusive culture that encourages all people to reach their full potential. Michigan State University Extension programs and materials are open to all without regard to race, color, national origin, gender, gender identity, religion, age, height, weight, disability, political beliefs, sexual orientation, marital status, family status or veteran status. Issued in furtherance of MSU Extension work, acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture. Jeff Dwyer, Director, MSU Extension, East Lansing, MI 48824.
